

# Second International Symposium on Candidate Genes for Animal Health

16–18 August 2002, Montpellier – France

## **SCIENTIFIC COMMITTEE AND CHAIR PERSONS**

MAILLARD Jean-Charles (Organisation)	CIRAD-Emvt, Montpellier, France
BEAUMONT Catherine	INRA Tours, France
BISHOP Steve	Roslin Institute Edinburg, UK
CHARDON Patrick	INRA Jouy-en-Josas, France
HANOTTE Olivier	ILRI Nairobi, Kenya
HORIN Petr	IABG Brno, Czech Rep.
LANTIER Frédéric	INRA Tours, France
LEWIN Harris	University of Illinois Urbana, USA
MALLARD Bonnie	OVC Guelph, Canada
MINVIELLE Francis (GSE)	INRA Jouy-en-Josas, France
PINARD VAN DER LAAN Marie Hélène	INRA Jouy-en-Josas, France
RAADSMA Herman	University of Sydney, Australia
RENARD Christine	INRA Jouy-en-Josas, France
ROTHSCHILD Max	Iowa State University, USA
SCHWERIN Manfred	FBN Dummerstorf, Germany
WALAWSKI Krzysztof	University of Warmai and Mazury, Poland

## **GUEST EDITORS OF THE SPECIAL ISSUE OF GSE ON CANDIDATE GENES FOR ANIMAL HEALTH**

MAILLARD Jean-Charles	CIRAD
PINARD VAN DER LAAN Marie-Hélène	INRA

## INTRODUCTION

Following the First International Symposium on “Candidate Genes for Animal Health” held in Rostock (Germany) in 1999, the Second International Symposium on this topic was organised by CIRAD and INRA in Montpellier (France). It took place in August 2002, after the 28th Conference of the International Society of Animal Genetics (ISAG) in Göttingen (Germany) and right before the 7th World Congress on Genetics Applied to Livestock Production (7WCGALP) also held in Montpellier.

The sequential schedule and the European location of these three meetings allowed all of us involved in the Genetics of Animal Diseases, to share up-to-date results, and to explore the state of the art of the complementary quantitative and molecular approaches.

The *centre international en recherches agronomiques pour le développement* (CIRAD) and the *institut national de la recherche agronomique* (INRA) were honoured to welcome distinguished scientists from all over the world who attended the Second CGAH Symposium. Around 100 participants from 31 countries were registered and contributed oral and poster communications. The studies presented during the symposium addressed one common interest: genes for disease resistance. But the models and approaches varied. Several livestock species were studied (ruminants, pigs, chickens...) and different types of diseases, both infectious (bacterial, viral and parasitic) and non-infectious, were analysed as well as refined immune mechanisms. The methods presented to identify target genes covered the main molecular techniques available, showing different levels of characterisation: QTL, SNP... Emerging techniques approaching functional genomics as a tool for exploring the genetic variability of genetic resistance were presented. Strategies and opportunities to utilise different facets of these “genes for animal health” to breed for disease resistance were addressed and discussed during this symposium.

At the same time, the participants had the opportunity to submit a paper for publication in this special issue of GSE, and fifteen articles were selected jointly by the Editorial Board of the journal and by the Guest Editors.

# I

## **NOVEL STRATEGIES AND TOOLS OF THE CANDIDATE GENE APPROACH**

## **II**

### **MECHANISMS OF DEFENSE AGAINST INFECTIONS**

### **III**

## **GENETIC RESISTANCE / SUSCEPTIBILITY TO INFECTIOUS DISEASES**

## **IV**

### **GENETIC RESISTANCE / SUSCEPTIBILITY TO NON-INFECTIOUS DISEASES**

**V**

**APPLICATIONS: BREEDING PROGRAMMES  
AND MARKER-ASSISTED SELECTION**
